**Please find below and/or attached an Office communication concerning this application or proceeding.**

The time period for reply, if any, is set in the attached communication.

Notice of the Office communication was sent electronically on above-indicated "Notification Date" to the following e-mail address(es):

docketing@ll-a.com  
gengelso@ll-a.com

## Office Action Summary

Application No.

10/698,610

Applicant(s)

GANDAR, MARC

Examiner

Backhean Tiv

Art Unit

2151

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --  
Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

### Status

- 1) ☒ Responsive to communication(s) filed on 10/17/07.  
2a) ☒ This action is **FINAL**. 2b) ☐ This action is non-final.  
3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

### Disposition of Claims

- 4) ☒ Claim(s) 1-9 is/are pending in the application.  
4a) Of the above claim(s) \_\_\_\_\_ is/are withdrawn from consideration.  
5) ☐ Claim(s) \_\_\_\_\_ is/are allowed.  
6) ☒ Claim(s) 1-9 is/are rejected.  
7) ☐ Claim(s) \_\_\_\_\_ is/are objected to.  
8) ☐ Claim(s) \_\_\_\_\_ are subject to restriction and/or election requirement.

### Application Papers

- 9) ☐ The specification is objected to by the Examiner.  
10) ☐ The drawing(s) filed on \_\_\_\_\_ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.  
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).  
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).  
11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

### Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).  
a) ☐ All b) ☐ Some \* c) ☐ None of:  
1. ☐ Certified copies of the priority documents have been received.  
2. ☐ Certified copies of the priority documents have been received in Application No. \_\_\_\_\_.  
3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).  
\* See the attached detailed Office action for a list of the certified copies not received.

### Attachment(s)

- 1) ☒ Notice of References Cited (PTO-892)  
2) ☐ Notice of Draftsperson's Patent Drawing Review (PTO-948)  
3) ☐ Information Disclosure Statement(s) (PTO/SB/08)  
Paper No(s)/Mail Date \_\_\_\_\_.  
4) ☐ Interview Summary (PTO-413)  
Paper No(s)/Mail Date. \_\_\_\_\_.  
5) ☐ Notice of Informal Patent Application  
6) ☐ Other: \_\_\_\_\_.

**Detailed Action**

Claims 1-9 are pending in this application. This is a response to the Amendment/Remarks filed on 10/17/07. This action is made **FINAL**.

***Priority***

Receipt is acknowledged of papers submitted under 35 U.S.C. 119(a)-(d), which papers have been placed of record in the file.

***Claim Rejections - 35 USC § 103***

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

Claims 1-9 are rejected under 35 U.S.C. 103(a) as being unpatentable over US Publication 2002/0169886 issued to Saito et al.(Saito) in view of US Patent 5,666,363 issued to Osakabe et al.(Osakabe).

As per claim 1, Saito teaches a method for exchanging information frames over a network between a plurality of devices, each device of the plurality of devices comprising a communication circuit connected to a processing unit and comprising a plurality of addresses(Fig.2-3), each address being associated with one of a transmission indicator or a reception indicator, wherein each address is associated with

a memory containing an information frame that can be at least one of modified and read by the processing unit and wherein only a single device of the plurality of devices includes one of the plurality of addresses associated with the transmission indicator(Fig.3,8,para.0058), the steps of:  
having a master device periodically transmit an address of the plurality of addresses(Fig.4,para.0017, 0063); and responsive to transmission of the address by the master device(para.0058-0060).

Saito however does not explicitly teach having the communication circuit of the device for which the address transmitted by the master device is associated the transmission indicator transmit the information frame contained in the memory associated with the address and provide its processing unit with an identifier of the address; and having the communication circuit of each device for which the address transmitted by the master device is associated with the reception indicator write into the memory associated with the address of the information frame and provide its processing unit with an identifier of the address.

Osakabe teaches having the communication circuit of the device for which the address transmitted by the master device is associated the transmission indicator transmit the information frame contained in the memory associated with the address and provide its processing unit with an identifier of the address(Figs. 1-11, col.2, liens 20-65); and having the communication circuit of each device for which the address transmitted by the master device is associated with the reception indicator write into the

memory associated with the address of the information frame and provide its processing unit with an identifier of the address(Figs. 1-11, col.9, lines 5-col.10, line34);

Therefore it would have been obvious to one ordinary skill in the art at the time of the invention to modify the teachings of Saito to include having the communication circuit of the device for which the address transmitted by the master device is associated the transmission indicator transmit the information frame contained in the memory associated with the address and provide its processing unit with an identifier of the address; and having the communication circuit of each device for which the address transmitted by the master device is associated with the reception indicator write into the memory associated with the address of the information frame and provide its processing unit with an identifier of the address as taught by Osakabe in order for bi-direction communication between devices(Osakabe, col.1, lines 5-15).

One ordinary skill in the art would have been motivated to combine the teachings of Saito and Osakabe in order to bi-direction communication between devices(Osakabe, col.1, lines 5-15).

As per claim 2, the method of claim 1, wherein the processing units of each of the plurality of devices, except for the processing unit of the master device , can neither read nor modify the plurality addresses and the transmission and/or reception indicators of the communication circuit to which they are connected(Saito, para.0058-0059).

As per claim 3, the method of claim 1, wherein all communication circuits further comprise a first address identical for all devices and associated with a transmission indicator and a second address identical for all devices and associated with a reception

indicator, the connection of a new device to the network (Saito, para.0058-0063)comprising the steps of: having the master device periodically transmit the first address(Saito, para.0058-0069); having the communication circuit of the new device, upon reception of the first address, transmit an identification frame(Saito, para.0065); having the master device successively transmit the second address and a parameterizing frame defined based on the identification frame(Saito, 0068-0071); having the communication circuit of the new device, upon successive reception of the second address and of the parameterizing frame, modify its addresses and reception and/or transmission indicators based on the parameterizing frame(Saito, 0068-0071).

As per claim 4, the method of claim 3, wherein each device of the plurality of devices comprises a specific identification number stored in the communication circuit of the device, the identification frame transmitted by the communication circuit of the new device comprising the specific identification number of said new device, the parameterizing frame transmitted by the master device comprising the specific identification number of the new device(Saito, para.0058-0060).

As per claim 5, the method of claim 3, wherein the communication circuit of the new device transmits no data as long as it has not received the first address(Saito, para.0048-0050).

As per claim 6, the method of claim 3, wherein the communication circuit of each device comprises a privilege indicator at a first value when the device is capable of transmitting addresses over the network and at a second value otherwise, said privilege

indicator being set to the first or to the second value by the communication circuit of the new device based(Osakabe, Fig.1-11). Motivation to combine set forth in claim 1.

As per claim 7, Saito teaches a device that can be connected to a network comprising: a communication circuit connected to a processing unit and including an address table , a register table, and each register in the register table being associated with an address in the address table(Fig.2).

Saito does not explicitly teach the direction table comprising one direction indicator per address, said processing unit being capable of reading information frames stored into the registers or writing information frames in the registers, said communication circuit being capable, upon reception of a request received from the network and corresponding to one of said addresses, of transmitting over the network the information frame stored in the register associated with said address in response to the corresponding direction indicator being a first determined type, of writing an information frame received from the network into the register associated with said address in response to the corresponding direction indicator being a second determined type, and of transmitting to said processing unit an identifier of the register associated with said address.

Osakabe teaches the direction table comprising one direction indicator per address, said processing unit being capable of reading information frames stored into the registers or writing information frames in the registers, said communication circuit being capable, upon reception of a request received from the network and corresponding to one of said addresses, of transmitting over the network the information

frame stored in the register associated with said address in response to the corresponding direction indicator being a first determined type, of writing an information frame received from the network into the register associated with said address in response to the corresponding direction indicator being a second determined type, and of transmitting to said processing unit an identifier of the register associated with said address(Figs.1-11, col.9, lines 5- col.10, line 34).

Therefore it would have been obvious to one ordinary skill in the art at the time of the invention to modify the teachings of Saito to the direction table comprising one direction indicator per address, said processing unit being capable of reading information frames stored into the registers or writing information frames in the registers, said communication circuit being capable, upon reception of a request received from the network and corresponding to one of said addresses, of transmitting over the network the information frame stored in the register associated with said address in response to the corresponding direction indicator being a first determined type, of writing an information frame received from the network into the register associated with said address in response to the corresponding direction indicator being a second determined type, and of transmitting to said processing unit an identifier of the register associated with said address as taught by Osakabe in order for bi-direction communication between devices(Osakabe, col.1, lines 5-15).

One ordinary skill in the art would have been motivated to combine the teachings of Saito and Osakabe in order to bi-direction communication between devices(Osakabe, col.1, lines 5-15).

As per claim 8, the device of claim 7, wherein the address table comprises a first address identical for all the devices connected to the network, the direction table comprising a direction indicator associated with said first address of the first determined type, the communication circuit of the device being adapted to transmitting said addresses and the associated direction indicators over the network upon reception of said first address(Saito, para.0017, Osakabe, Figs.1-11, col.9, lines 5- col.10, line 34). Motivation to combine set forth in claim 7.

As per claim 9, the device of claim 8, wherein the address table comprises a second address identical for all device connected to the network , the direction table comprising a direction indicator associated with said second address of the second type, and being capable, upon successive reception of said second address and of a parameterizing frame, of modifying said addresses and the associated direction indicators based on the parameterizing frame(Saito, para.0017,0058-0081, Osakabe, Figs.1-11, col.9, lines 5- col.10, line 34). Motivation to combine set forth in claim 7.

### ***Response to Arguments***

The Office withdraws all previous rejection due to applicant's amendments.

Applicant's arguments with respect to claims 1-9 have been considered but are moot in view of the new ground(s) of rejection.

### ***Conclusion***

**Examiner's Note:** Examiner has cited particular columns and line numbers in the references as applied to the claims above for the convenience of the applicant.

Although the specified citations are representative of the teachings of the art and are applied to the specific limitations within the individual claim, other passages and figures may apply as well. It is respectfully requested from the applicant in preparing responses, to fully consider the references in its entirety as potentially teaching of all or part of the claimed invention.

The prior art made of record and not relied upon is considered pertinent to applicant's disclosure. See PTO-892.

Applicant's amendment necessitated the new ground(s) of rejection presented in this Office action. Accordingly, **THIS ACTION IS MADE FINAL**. See MPEP § 706.07(a). Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire **THREE MONTHS** from the mailing date of this action. In the event a first reply is filed within **TWO MONTHS** of the mailing date of this final action and the advisory action is not mailed until after the end of the **THREE-MONTH** shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than **SIX MONTHS** from the date of this final action.
